

## **1. Introduction**

The purpose of this project is to enable students to apply the programming concepts learned in **Fundamentals of Programming II** through the design and development of a real-world C++ application. Students are expected to demonstrate problem-solving skills, teamwork, software development best practices, and technical documentation.

The project shall be completed in groups using collaborative development tools and shall conclude in a working software application, documentation, and project presentation.

## **2. Learning Objectives**

Upon successful completion of the project, students should be able to:

- Analyze real-world problems and understand system requirements.
- Design algorithms and program structures.
- Develop a complete C++ implementation.
- Implement appropriate programming techniques.
- Use GitHub for collaborative application development.
- Produce professional technical documentation.
- Present and defend their work effectively.

## **3. General Project Requirements**

The project implementation must demonstrate the following programming concepts:

- Structures and/or Classes
- Functions
- Arrays
- Pointers
- Function/class Templates
- File Handling
- Menu-Driven Programming
- Object-Oriented Programming Principles (if applicable)

#### 4. Functional Requirements

The project must provide the following minimum functionalities:

a. **User-friendly Menu System** that allows users to navigate and perform operations easily

b. The system shall support the following **Data Management Operations**:

- Add new records
- Display records in tabular format
- Update existing records
- Delete individual records
- Delete all records (with confirmation)
- Search records using relevant keys
- Sort records in ascending and descending order

c. The application must allow user **save data to files** and **load data from files**

d. The system must support the following **Validation and Error Handling**

- Validate user inputs
- Handle invalid menu selections
- Prevent duplicate records where applicable
- Handle file-related errors gracefully

e. Students are expected to follow **programming best practices** including:

<p><b>i. Coding Standards</b></p> <ul style="list-style-type: none"><li>• Meaningful variable names</li><li>• Meaningful function names</li><li>• Consistent indentation</li><li>• Proper code formatting</li><li>• Modular design</li><li>• Appropriate comments</li><li>• Avoidance of code duplication</li></ul>	<p><b>ii. Documentation Standards</b></p> <ul style="list-style-type: none"><li>• Well-organized</li><li>• Properly formatted</li><li>• Consistent in font style and size</li><li>• Free from language errors</li></ul>
---	---

## 5. Project Deliverables

### a. Deliverable 1: Source Code

- Complete C++ source code
- Well-structured folder organization
- Proper commenting

### b. Deliverable 2: Project Documentation

- A comprehensive project report in PDF format.

### c. Deliverable 3: Presentation Slides

- Presentation summarizing problem definition, design, implementation, challenges and lessons learned

### d. Deliverable 4: Demonstration

- Live demonstration of the application during project defense.

## 6. Documentation Structure

The project report should contain the following sections:

1. Cover Page
2. Executive Summary
3. Problem Description
4. Requirement Analysis including IPO (Input-Process-Output) Analysis
5. Algorithm Design: Flowcharts, Pseudocode and
6. Description of Program Implementation
7. Challenges and Solutions
8. Conclusion and Recommendations
9. References

**Addis Ababa Science and Technology University**

## 7. Evaluation Rubric

No	Evaluation Component	Weight (%)
1	<b>Problem Analysis &amp; Design</b>	15
2	<b>Program Implementation</b>	30
3	<b>Required Programming Concepts</b>	20
4	<b>Documentation Quality</b>	10
5	<b>GitHub Contribution</b>	10
6	<b>Testing &amp; Validation</b>	5
7	<b>Presentation &amp; Demonstration</b>	10
	<b>Total</b>	<b>100</b>

## 8. Academic Integrity

Students are expected to maintain academic honesty.

The following are prohibited:

- Copying another group's project.
- Submitting downloaded projects as original work.
- Plagiarizing documentation.
- Misrepresenting contribution levels.

Violations may result in grade penalties or project rejection.

## **9. Problem Description**

### **9.1. Project Title:**

Student Record Management System

### **9.2. Background**

Colleges manage large volumes of student academic information, including personal details, course registrations, grades, and academic status. Manual management of these records is inefficient and increases the risk of errors.

A computerized Student Record Management System can streamline academic record management and improve decision-making through automated grade computation and reporting.

### **9.3. Problem Statement**

The department currently stores student academic records manually, making it difficult to:

- Track student performance.
- Calculate cumulative grades.
- Determine academic standing.
- Generate class rankings.
- Produce statistical reports.

The department requires an automated system capable of managing student records efficiently and accurately.

### **9.4. Project Description**

You are tasked with C++ application development for Student Record Management System that manages student information, course registration, grades, and academic performance.

The system should support:

- Student registration.
- Course registration.
- Grade management.
- GPA/CGPA calculation.
- Student ranking.
- Academic status determination.
- Statistical reporting.

All records should be stored in files for long-term access and retrieval.

### 9.5 Functional Requirements

---

1	Student Management	<ul style="list-style-type: none"><li>• Register students.</li><li>• Edit student records.</li><li>• Delete student records.</li><li>• Search students.</li></ul>
2	Course Management	<ul style="list-style-type: none"><li>• Register courses.</li><li>• Update course information.</li><li>• Search courses.</li><li>• Check prerequisite requirements</li></ul>
3	Grade Management	<ul style="list-style-type: none"><li>• Record grades.</li><li>• Update grades.</li><li>• Compute semester GPA.</li><li>• Compute cumulative CGPA</li></ul>
4	Academic Evaluation	<ul style="list-style-type: none"><li>• Determine student status: Pass, Warning, Dismissal</li><li>• Generate student ranking.</li><li>• Identify top-performing students</li></ul>
5	Reporting	<ul style="list-style-type: none"><li>• Number of students.</li><li>• Pass rate.</li><li>• Warning rate.</li><li>• Department statistics.</li><li>• CGPA distribution</li></ul>

---

### 9.6. Expected Outputs

The system should generate:

- Student transcript.
- Semester report.
- CGPA report.
- Academic status report.
- Ranking report.
- Statistical summaries.
